

Mosaic Feature of AVPlayer Overview

How to apply Mosaic:

Open AVPlayer program and select a video file to play.

You may add the mosaic overlay when the video is playing or when it is paused:

- Select the “Mosaic” checkbox.
- Move the mouse pointer to the top left of the area to be “blurred.”
- While holding down the mouse button, drag the pointer down and Right until the mosaic area has been highlighted.
- You may have up to 4 areas selected on each full screen 1-camera view.
- You may have up to 16 areas selected (4 in each quadrant) on each Quad screen.

To remove mosaic blurred areas deselect the “Mosaic” checkbox.

Mosaic overlays recycle the same as the memory recycles when it is full erasing the oldest and replacing it with the newest file.

To clear existing mosaic areas:

For example, 4 mosaic areas for each camera file will be numbered 1st, 2nd, 3rd, 4th. Every mosaic area is selected, it will be saved to the file, meaning when you open the same file again, check the “Mosaic”, 4 older mosaic areas are there. Now suppose you’re trying to select a new area (the 5th), after it is selected, the 1st will be removed, if you select a 6th area, the 2nd will be removed. 7th area is selected, 3rd to be removed, 8th is selected, the 4th will be removed.

Important Note:

If you choose the “On Screen Text” area, the text will be blurred as well.
