Mini Camera 420TVL Resolution

“SDBB” System with Low Cost DVR & Mini Camera

“SDBB” is a way to have a low cost conventional mobile video solution for much less than a typical mobile video system as several costly features have been removed to reduce the price so that this system can now be a lower cost alternative to the full feature systems offered.

Leading Features Built Into SDBB DVR

- 32 GB 100% Solid State Digital memory capacity, Mobile DVR for rugged reliable data memory storage
- 1-channel DVR can accept 1 camera with 1 channel of audio
- Video Files viewable on 3rd Party Players like VLC media player & Windows Media Player (WMP) w/codec plug-in
- Play the recorded video files back using the unit connected to TV, or SD card in PC w/codec plug-in
- D1 high resolution from 1 camera & H.264 compression for images 4 times clearer than CIF technology

Optional Camera Upgrades available:

PD High Resolution 600TVL

BTC High Resolution 600TVL Metal Vandal Resistant

Important Notice:

The SDBB “Bare Bones” DVR is a low cost configuration with abbreviated programming lacking some features of our standard mobile video solutions in order to reduce the cost. The SDBB does not have “Vehicle ID#” in the programming, or on screen display. This means the playback will not display what vehicle the recording came from. Those who require “Vehicle ID#” on the video playback should invest in the SDm series as they offer this feature at a low cost. Those who require GPS On Screen Mapping on the video playback should invest in the SDmG series as they offer this feature at a low cost.

Mini & PD cameras are NOT suitable for any high-risk application where vandals can access and damage the cameras. All DVR specifications, features, hardware subject to frequent change by the manufacturer without notice as improvements are integrated

All DVR specifications, features, hardware subject to frequent change by the manufacturer without notice as improvements are integrated.
Some versions of Third Party Players require AVI codec plug-in to enable AVI file playback. Memory storage drastically affected by FPS & resolution
